How Recall Works in Advertising

Spot Length and Unaided Recall in Television: Optimizing Media Planning Variables in Advertising Breaks
Greater recall results from lower levels of advertising clutter, report J. D. Martín-Santana (Universidad de Las Palmas de Gran Canaria), P. Reinares-Lara, and E. Reinares-Lara (Universidad Rey Juan Carlos, Madrid). Advertisers should seek to negotiate insertion of their longer spots in shorter ad blocks. P274

Limited- Interruption Advertising in Digital-Video Content: Comparing the Effects of “Midroll” vs. “Preroll” Spots and Clutter Advertising
Authors J. Brechman (The College of New Jersey), S. Bellman (Ehrenberg-Bass Institute/University of South Australia), J. A. Robinson (RMIT), with A. Rask and D. Varan (MediaScience) find that less is more: Fewer advertising breaks, with fewer and shorter spots help break up the clutter and improve recall. P289

Comparing Brand Placements and Advertisements on Brand Recall and Recognition
A strategy that combines commercials with brand placements in TV programs might enhance the persuasiveness of a message. It also costs less than buying two spots in a commercial break, D. Davtyan (University of Texas/Austin), K. Stewart (California State University/San Marcos, I. Cunningham (University of Texas/Austin). P299

The user bias in memory for advertising is not a measurement artifact but a real phenomenon, occurring under a wide range of conditions. K. Vaughan, V. Beal, J. Romaniuk (Ehrenberg-Bass Institute). P311
